CRAFT BEARING

CRAFT
Bearing Company, Inc.

THE SPLIT BEARING

Craft Bearing Company manufactures Split Cylindrical Roller Bearings which combine all the advantages of conventional anti-friction roller bearings with the added feature of being easily assembled around a shaft. The complete assembly is engineered in halves to ease installation, inspection, and /or replacement of pillow block bearings without removing or disrupting other elements of the system. **The Split makes the difference!** The Craft Bearing and all its component parts are manufactured in the United States.

PILLOW BLOCK

The Craft Pillow Block consists of the Cartridge Assembly (with either a Float or Held Bearing) and the Housing Assembly, which is made of quality ductile iron. The inside diameter of the housing is spherically machined to accept the Cartridge Assembly. The base to center height of the Pillow Block meets and in some cases is less than the industry standard. In cases where shim stock is used to increase the base to center height needed for a given application, it is imperative that the housing base be completely supported.

NOTE All hardware used in the assembly of the Craft Pillow Block is of the American standard type, not metric.

Bearings, cartridges, and housings of the same series and grouping are interchangeable with each other. However, their integral parts are not.

CARTRIDGE ASSEMBLY

The Craft Cartridge Assembly consists of the following component parts:

- Either the Float or Held Bearing (as the application requires)
- Aluminum triple labyrinth-ATL-seals (standard, other seals available upon request)
- The Cartridge itself, made from high-quality ductile iron

The outside diameter of the cartridge is spherically machined to accommodate initial shaft misalignment. This allows the Bearing and Cartridge Assembly to align externally. The seal remains on a parallel axis with the shaft, maintaining a 100% seal along the shaft.

All bearing outer races are positioned in the cartridge by side pusher screws. This allows the proper positioning of the outer races in the cartridge. The side pusher screws must be backed off before attempting to remove outer races.

The Craft Cartridge Assembly may be purchased separately for replacement in a Craft Housing or other appropriate mounting fixtures.

FLOAT BEARING (Non-locating)

The Craft Float Bearing (FL suffix) allows unrestricted axial movement, either expansion or contraction. The roller assembly is held in place by the flanges of the inner race clamping collars, while allowing the roller cage assembly to locate itself, or float, across the face of the outer race. As a result, the roller does not sustain axial forces while retaining full radial load carrying capacities.

HELD BEARING (LOCATING)

The Craft Held Bearing (HD suffix) is installed as a fixed bearing to locate the shaft and direct shaft expansion in either axial direction. The flanges of the clamping collars and the shoulders of the outer race form a guide path which contain the rollers, eliminating axial float while accommodating thrust. The Held Bearing handles axial loading virtually independent of the radial load. Only one Held Bearing should be applied to a single shaft segment. The other support bearings should be Float Bearings.

MATERIALS

Materials used in Craft Pillow Block Bearings meet or exceed the standards set by the American Bearing Manufacturers Association (ABMA). The rolling elements and parts forming the running surfaces of the bearing are made of SAE 52100 high carbon chromium steel, through hardened, to give optimum fatigue life and dimensional stability. The cartridge and housing are made of cast ductile iron, for higher tensile strength and elasticity, and substantially more ductility over conventional cast iron.

BEARING LOAD RATINGS AND LIFE

All calculations to determine the load carrying capacities of the Craft Bearing are based on and in accordance with ABMA and International Organization for Standardization (ISO) standards.

Basic Rating Life

L10, or Basic Rating Life, is defined by the ISO formula, $L_{10} = (C_R/P_R)^p$, where:

L10 = Basic Rating Life, in millions of revolutions

C_R = Basic Dynamic Load Rating

P_R = Dynamic Equivalent Radial Load

p = Exponent of the Life Equation 10/3

L10 is the minimum expected life for 90% of a group of like bearings. Median life, which 50% of the group will complete or exceed, is approximately five times the rating life.

CUSTOM WORK

Stainless steel cartridges and housings and special application bearings are available upon request. Please contact our Engineering Department.

BEARING LUBRICATION

The primary purpose of lubrication is to establish a load carrying film on the component parts of the bearing so that metal to metal contact is avoided between the rolling elements. Lubrication also acts as an inhibitor to corrosion and assists in the sealing process. Appropriate lubrication selection must be based on the critical criteria (speeds, loads, temperatures, etc.) of the bearing application.

Grease Lubrication

Grease of a #2 consistency with an EP (extreme pressure) additive is the preferred lubricant in most normal applications. All Craft Cartridges have a grease fitting, allowing the lubricant direct access to the rolling surfaces of the bearing. Depending on the application, excessive grease will result in an abnormal rise in bearing temperature. Therefore, Craft Cartridges are also supplied with purging capabilities. This is done by removing the purge plug, located in the lower half of the cartridge, and allowing the grease to seek its own level. Once this is accomplished, the plug is then replaced.

Greasing Capacities

All bearing component parts should be cleaned and free of preservatives and contaminants. As the component parts of the bearing are assembled around the shaft, they should be hand coated with grease. The bearing should never be assembled dry and the lubricant injected after the unit is mounted. As a general guide, grease should be applied based on the following chart.

dn (RPM x Shaft Size)	Percentage of Packing (See chart, Grease Capacity)
0 to 2000	100%
2000 to 4000	75%
4000 to 6000	50%
6000 to 8000	33%
8000 and up	25%

Greasing Schedules

Held Bearing (Locating) Due to the cycloidal action of the rollers against the flanges of the clamping collars and the shoulders of the outer raceway, the Held Bearing requires a more frequent lubrication schedule than the Float Bearing. Every 250 operating hours, or at two-week intervals, the bearing should get three to four shots of grease (1/2 oz.), with a suggested yearly thorough cleaning and re-lubrication.

Float Bearing (Non-locating) Every 500 hours, or at one month intervals, the bearing should get three to four shots of grease, with a suggested yearly thorough cleaning and re-lubrication.

The above greasing schedule is for reference only, and may be modified to accommodate the application. Experience will determine the best interval for each application.

Oil Lubrication

Oil lubrication may be required in applications where extreme speed, high axial load, temperature, and/or other operating conditions may be factors. To insure proper selection and utilization of oil lubrication, please contact Craft Bearing's Engineering Department.

NOTE Axial capacity and maximum RPM may be reduced when extreme pressure grease or oil lubrication is not used.

Radial Load: $Pr = \frac{Cr}{fd} \times \left(\frac{16,667}{n \times L10} \right)^3$ Axial Load: $Pa = \frac{Ca \times SF}{n}$ or .05 x Co, whichever is less
 SF = speed factor = 1000 RPM for small bore (600 group and below)
 100 RPM for large bore (608 group and above)

Cr=Dynamic Radial Load Rating
 Ca=Dynamic Axial Load Rating

Co=Static Radial Load Rating
 n=RPM

Above ratings are based upon a minimum life of 30,000 hours (L10) and utilization of EP grease, and a service factor (fd) of 1.2.

Radial Load: $Pr = \frac{Cr}{fd} \times \left(\frac{16,667}{n \times L10} \right)^3$ Axial Load: $Pa = \frac{Ca \times SF}{n}$ or .05 x Co, whichever is less

SF = speed factor = 1000 RPM for small bore (600 group and below)
100 RPM for large bore (608 group and above)

Above ratings are based upon a minimum life of 30,000 hours (L10) and utilization of EP grease, and a service factor (fd) of 1.2.

Cr=Dynamic Radial Load Rating
Ca=Dynamic Axial Load Rating

Co=Static Radial Load Rating
n=RPM

APPLICATIONS IN VARIOUS INDUSTRIES FOR CRAFT SPLIT ROLLER BEARINGS

Craft Split Roller Bearings are predominately used in the heavier end of industry—where a high degree of reliability and a minimum of maintenance and downtime are required. These demanding applications include iron, steel, and other primary metals; mining, quarries, marine propulsion, power generation, lumber and veneer manufacturing; glass manufacturing, auto assembly plants, food, chemical, oil refineries, water and wastewater treatment, and paper making, to name a few. The following represents some of the numerous types of machinery and industries where our split bearings are of benefit to your bottom line.

Mining/Aggregate/Asphalt/Ready Mix: Cleaning, processing, general mineral extraction: Fans, conveyors, bucket elevators, mine hoist gearing, crushers and pulverizers, floatation cells, ball and rod mills, pug mills, cage mills, hammer mills, reciprocating screens, gen sets, etc.

Iron and Steel: Coal crushers, drag conveyors, roll out tables, cooling beds, transfer beds, mill drives, cranes, bag house fans, primary air fans, charging car conveyors, etc.

Cement Production: Clinker crushers, clinker coolers, conveyors, fans (bag house, etc.), bucket elevators, ball and rod mills.

Marine: Fans, propulsion shafting, gearboxes, winches, on board conveyors.

Sugar, Beet and Cane: Cane knives, carriers and feeders, shredders, crushers, belt conveyors, line shafts, washers, fans, press rolls, pulp shredders, bucket elevators.

Flour Mills: Line shafting, fans, bucket elevators, man lift.

Large electric motors (mill drives, etc.) and generator sets for auxiliary/emergency power.

Pulp and Paper: Mixers, conveyors, agitators, fans, log decks, chip conveyors, wood hogs, calendar and press rolls, paper drying cylinders, re-winders, line shafting, hydra-pulpers.

Lumber: Dry kilns and OSB ovens, log decks, chain and belt conveyors, fans, wood hogs, grinders, etc. - in dimensional lumber, chipboard, OSB, and plywood veneer plants.

Power Generation: Ball Mills, FD and HD fans, belt conveyors, barge unloaders, crushers, pulverizers, coal breakers, generator sets, pumps, **horizontal/vertical hydro generators.**

Water and Wastewater Treatment: Paddle wheel and rocker arm mechanical flocculators, rotary and disc aerators, RBC's, CBC's, tank scrapers, rotary screens, sludge presses, conveyors, fans, pumps, etc.

Chemical, Pharmaceutical, Petro-chemical, etc.: Fin fans, air handlers, pumps, line shafts, conical, vee and double cone dryers, vacuum dryers, ribbon and paddle blenders, others.

Food Processing: Bottle washers, canning machines, steamers and cookers, steam peelers, cereal dryers, fans, hammermills and grinders, conveyors, etc.

APPLICATION DATA SHEET

Equipment type/application: _____

Shaft diameter: _____ Current bearing type and model number: _____

Shaft speed: _____ Motor H.P. _____ Ambient temperature: _____

Type of drive: ☐ Direct drive ☐ Belt drive ☐ Gear drive ☐ Gear reduction (Ratio)

Radial load: _____ Axial load: _____ Shaft temperature: _____

Service duty (24/7, etc.): _____ Life requirements: _____

Environment: ☐ Dirty ☐ Wet ☐ Caustic ☐ Acidic ☐ Neutral

Additional Information for Fan Application: Single inlet, over hung load: _____

Double inlet, center hung load: _____ Wheel and shaft weight: _____

Air temperature inside fan: _____ Fan Inlet diameter: _____

Static pressure in inches of water (fan spec sheet) _____ (S.P.W.G.)

Comments, special considerations, return contact information:

Feel free to contact Craft if you have any questions or we may be of further service.

THANK YOU.

CRAFT SPLIT ROLLER BEARINGS

INSTALLATION

Reference Assembly Instructions below

ASSEMBLY PREPARATION

Confirm proper bearing selection has been made. Check shaft journal for roundness and size (as a general guide, $+0.000$ " to -0.005 " on diameter is acceptable). Ensure that the bearing and surrounding work areas are free of dirt and other contaminants.

ASSEMBLY (SEE DRAWINGS ABOVE)

1. Dismantle pillow block and clean bearing parts with a government-approved solvent. It is not necessary to remove outer race from cartridge.
2. Apply grease between the o-ring centers before assembling the Triple Labyrinth (TL) seals. Install the TL seals and move to the outer perimeter of the bearing journal.
3. Position inner race in proper location observing matching marks.
4. Fit the clamping collars at approximately 45 degrees from the inner race joints, insuring that there is an equal gap at the inner race joints. Tap down clamping collars with a mallet and tighten the high tensile screws equally, repeating until collars are properly seated.
5. Remove packing fasteners and ensure that provided "nyloc" screws are used to secure cage halves at joints. Coat the inner race and roller cage assembly with liberal amounts of

grease. Install roller cage assembly, making sure that the cage clips or "nyloc" screws are securely in place.

6. Position seals so that they are in alignment with the grooves of the cartridge. Apply grease to the two grooves that form the outside diameter of the seals. This serves two functions: 1. To lubricate the running surfaces of the seals and cartridge. 2. To seal bearing and stop contaminants from working their way through the labyrinth and entering the bearing.
7. At this time, coat the running surface of the outer race with grease. Never assemble bearing dry, load carrying surfaces must be lubricated during assembly. Check cartridge match marks carefully, then assemble cartridge.
8. After cartridge halves are assembled, coat the spherical outside diameter of the cartridge and the bore of the housing with a graphite compound. Introduce the required amount of lubricant into the cartridge assembly.
9. Place the housing base into position, insuring that the bottom of the base is level and supported 100%. Install the housing cap. Rotate the shaft to align the cartridge assembly within the housing. Tighten the housing cap screws.

NOTE Before shafting is jacked up, all housing cap bolts should be backed off

(DISASSEMBLY IS THE REVERSE)

Warranty

Craft Bearing Company, Inc. will replace or repair any part or parts of Craft bearings that fail due to defective materials or workmanship that are returned to its factory within one year of delivery to the original purchaser. This constitutes Craft's only warranty in connection with the sale, is in lieu of all other warranties, expressed or implied, oral or written, and Craft shall have no responsibility for consequential or other damages. No employee, distributor, or agent is authorized to give any other warranty on behalf of Craft.
